FedEx Freight project: what I did, and why

What I did

After applying for the Data Science Internship, I wanted to show how I would work on a real question instead of only describing my skills. I chose one I expect matters to FedEx Freight right now: from mid-2021 to mid-2026, its share of daily shipments among the five largest public LTL carriers fell 16.7 log-points, about a sixth. How much of that is price, and how much is something else?

Using only public data (SEC filings for FedEx Freight and four public competitors, FRED, the FAF5 freight database and EIA), I:

- built a quarterly carrier panel in which each number is used only after it was filed, so no model sees the future;
- wrote down my methods before fitting any model, and logged every change I made afterwards;
- estimated how shipment share responds to relative price using the four competitors only, then applied it to FedEx out of sample;
- backtested forecasting models, from a naive baseline to gradient boosting, over 2022 to 2026 and tested whether the differences were real;
- locked a forecast of FedEx Freight's June–September shipments per day (**−6.0%**) before the October 29 report, with its fingerprint committed to GitHub.

What I found: price explains the 2022–23 share loss, but not the losses in the year after Yellow's shutdown or the year to mid-2026, which points to account retention rather than pricing. A carrier's own in-quarter data cut forecast error 43%; machine learning's gain over the baseline was not statistically significant, and I reported that alongside what worked.

Why I did it this way

Pricing, capacity and account decisions in freight rest on numbers that have to hold up. I wanted to show that I check data before trusting it, compare every model against a simple baseline, and say plainly when a more complex method does not help. Locking the forecast in advance keeps me honest: on October 29 it will be right or wrong in public.

Why I'm a good fit

- **Analyst experience:** as a Data Analyst at TCS and now as a Data Analyst Intern with the Shelby County District Attorney General's office, my work has centered on data auditing, anomaly investigation, automated data-quality checks and operational reporting.
- **Tools:** SQL, Python, R, Excel, Power BI, Azure Databricks and ETL workflows.
- **Modeling foundation:** MS in Data Science at the University of Memphis (GPA 3.9), Weil Graduate Fellowship, and Teaching Assistant for Machine Learning.

Why this role matters to me

I want to build my career where models meet operations, where a forecast or a flag changes what happens on a dock or in a sales conversation. This project reached the limit of public data: quarterly numbers for five carriers. An internship at FedEx Freight would let me bring the same discipline to account-level and lane-level data, learn from a team that makes these decisions every day, and grow that career here in Memphis, where I live.

I would welcome 15 minutes to walk through the project, or to hear which questions matter most to your team. Thank you for considering my application.
